PARTNER OVERVIEW

Sayloom

● Available today ● Planned prototype

FROM IMPERFECT RECOGNITION TO USABLE TEXT

Keep what was heard. Prepare what was meant.

Sayloom receives text generated by Voiceitt and makes a separate **Prepared** version for review. The **Original** always stays available.

> **Important:** Sayloom receives text, not audio. The person who produced the text remains the authority on what they meant.

01 • Original

Start with Voiceitt-generated text

Please add the new ~~cash~~ to the project board.

The received wording remains editable and never disappears behind an automatic result.

02 • Prepared

Review Sayloom's suggested wording

Please add the new task to the project board.

Smart can repair likely word-recognition errors using one correction method today.

03 • Outgoing

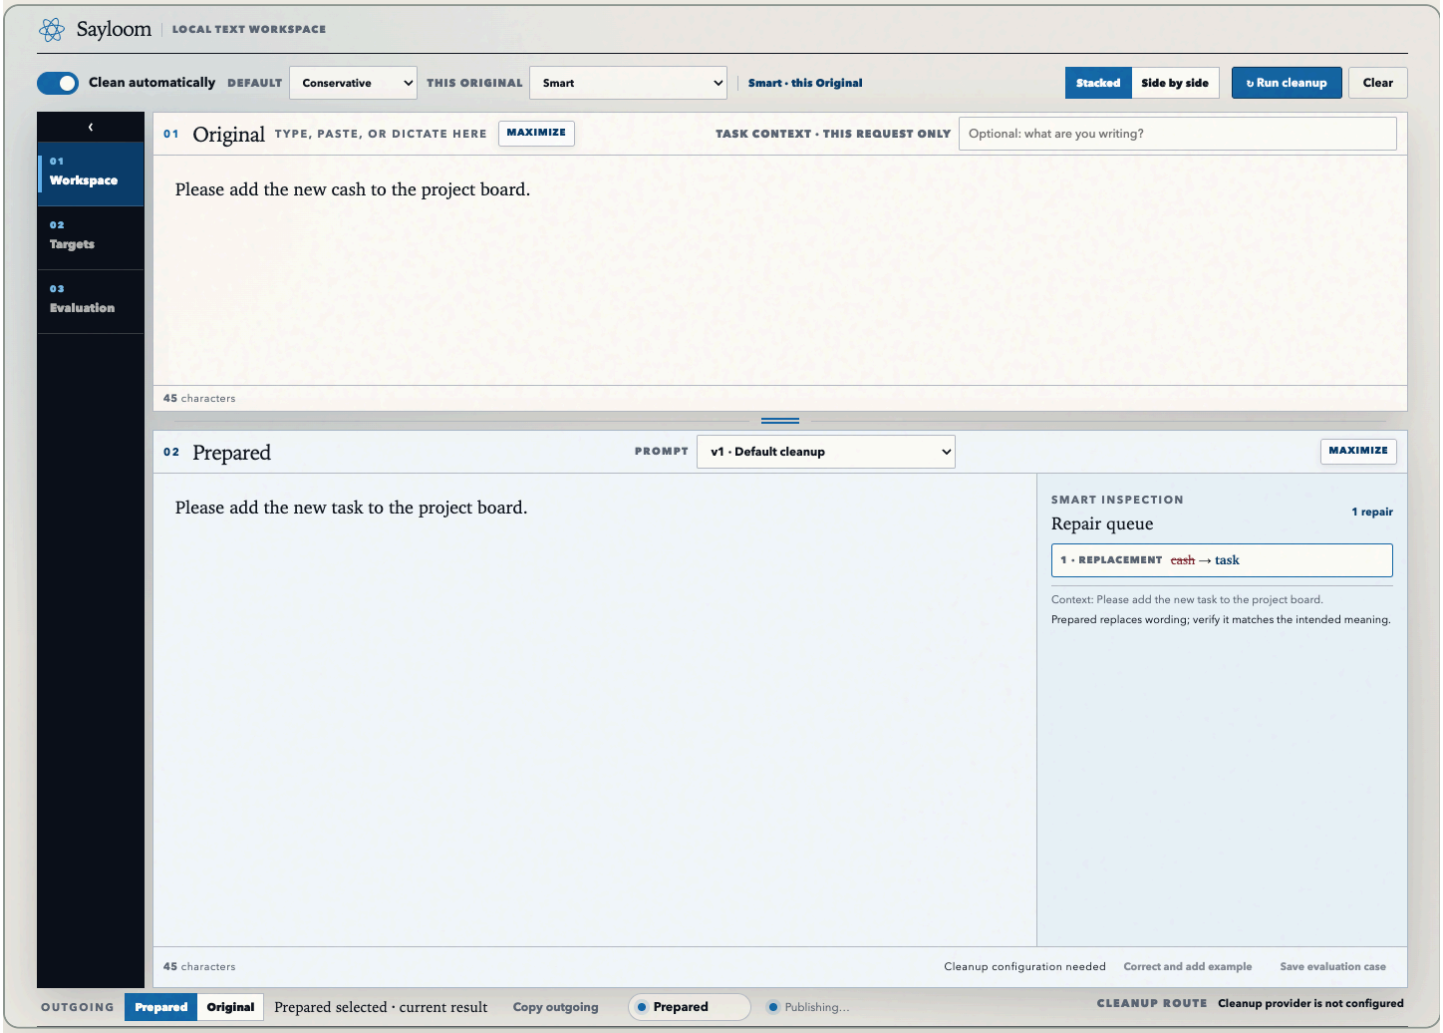

Choose exactly what leaves Sayloom

The person can copy or send Prepared—or choose Original instead. If correction fails, Sayloom fails open to Original.

AVAILABLE TODAY

A working review surface, not a hidden rewrite.

Original and Prepared sit together so changes can be inspected. Outgoing names the exact version selected for copying or delivery. The screenshot uses synthetic text in an isolated test setup that does not contact an AI provider.

Implemented Sayloom workspace · synthetic example · no private evidence or provider call

THE BOUNDARY

What exists now—and what does not.

The automatic-correction work is a prototype plan. It must earn its way into the product through private evidence; having tools to compare approaches is not proof that any approach works.

AVAILABLE TODAY

One reviewable correction path

- ✓ Editable Original and separate Prepared text
- ✓ Conservative and Smart modes
- ✓ Smart uses one correction method
- ✓ Meaning-bearing Smart repairs can be inspected
- ✓ Explicit Outgoing choice and fail-open Original

PLANNED PROTOTYPE

Automatic choice among several methods

- → Compare several correction methods fairly
- → Let Smart choose a method for each case
- → Count wrong choices, failures, and cases where correction cannot help
- → Keep every proposed repair reviewable
- → Integrate only a winner that meets success rules agreed before final results

PLANNED PROTOTYPE

Smart should choose carefully, not merely guess harder.

The prototype will test Smart as a whole. One promising correction method is not enough if Smart chooses it for the wrong text.

COMPARE

Try several methods

Test different ways of correcting text—and useful combinations—on the same qualifying examples.

CHOOSE

Choose inside Smart

Compare always using one method, trying methods in a set order, and choosing based on each piece of text.

PROTECT

Fail open to Original

If correction fails, takes too long, cannot help, or looks unsafe, usable Original text must remain available.

PROVE

Require private evidence

No approach reaches the product unless private examples set aside in advance meet success rules agreed before final results.

CURRENT EVIDENCE STATUS

The blocker is real.

The latest approved review found no cases that met the agreed requirements. That is a stop signal, not a result to explain away.

0

cases ready for evaluation in the completed review

This branch is building a private evidence-collection path so actual Voiceitt-generated text can be paired with producer-confirmed Intended wording before candidate output is seen.

- Private text stays in approved user-controlled storage outside Git and application state.
- The current branch provides a local way to collect examples without contacting an AI provider; the planned in-browser collection interaction is not built yet.
- Evidence remains insufficient until the examples cover every required situation and enough set-aside examples are available.

WHAT A PARTNER CAN TAKE AWAY

The review experience is real. Automatic multi-method correction still has to be demonstrated.

A later, separately authorized shareable pilot may let a small group try a qualified prototype. It would not be production hosting, deployment approval, or broad evidence that Sayloom works for everyone.

Source details: product authority · automatic-correction initiative · evidence blocker and collection plan

Sayloom is an independent, unaffiliated companion to Voiceitt. Voiceitt is a trademark of its respective owner. The example text is synthetic. This overview describes current implementation and planned prototype work; it is not proof that Sayloom works broadly.
