A COMPANION FOR CLEARER TEXT

Sayloom

WORKING DRAFT · COLLEAGUE REVIEW

Help us learn whether Sayloom could make corrected text easier to use

> **Working draft for colleague review — September 2026.** This is not yet a participant-ready invitation. The bracketed contact, session, consent, and privacy details must be finalized before recruitment begins.

Sayloom is preparing a small, guided tryout for people who use Voiceitt, the family members and support people who work with them, accessibility professionals, and community organizations.

The tryout will explore a simple question: after Voiceitt turns speech into text, can Sayloom help a person review and correct plausible-looking word errors without taking control away from them?

We are looking for prospective participants and partner organizations who may want to take part once the first-user checks are complete and the participant tryout is ready.

> **Interested in hearing more?** Contact **[name or organization]** at **[email, phone number, or accessible contact form]**. You can ask questions without committing to participate.

The problem we are working on

Speech recognition can produce a sentence that looks fluent but contains a word the speaker did not intend. Because the result is plausible, the error may be harder to notice than a visibly broken sentence. It can also change the meaning.

Voiceitt does the essential first job of recognizing speech and turning it into text. Sayloom is being developed as a companion for the next step. It receives the text and suggests limited corrections to words that may have been misrecognized. The person can review the suggestion, change the original text, or keep the original wording.

Sayloom does not listen to the speech or check a suggestion against a recording. It works only from the text it receives, the surrounding words, any temporary context the person chooses to provide, and personal terms or known confusions the person has explicitly approved.

Sayloom is independent and unaffiliated with Voiceitt. It is not part of the Voiceitt company or product, and this proposed tryout is not a Voiceitt program or an official Voiceitt integration. Sayloom is designed to complement Voiceitt, not replace it.

Why we are starting with a small tryout

The current work is not a broad participant study. It first develops and checks a reusable Smart-correction “recipe.” The recipe is the common set of rules Sayloom follows when it considers a correction. Those rules are meant to limit unnecessary rewriting, protect the apparent meaning, and leave uncertain words unchanged rather than guess.

The first checks use one person's private text to answer whether a fixed recipe is safe and useful enough to take to the next stage. The recipe can be shared, but that person's sentences, preferred terms, and known speech-recognition confusions are not part of it.

If the recipe passes its first-user checks, that result will apply only to the first user. It will not show that Sayloom works for other people. A later participant tryout is how we will begin to learn whether the approach is clear, respectful, and potentially useful to others.

Who may be a good fit

We would like to hear from:

- people with non-standard speech who use Voiceitt to produce text;
- family members or support people, when the Voiceitt user wants them involved;
- accessibility professionals who understand communication workflows; and
- community organizations interested in helping shape a respectful future tryout.

The person whose words are being corrected remains the authority on what they meant. A support person may help with access, navigation, or communication when invited, but does not decide whether a suggestion is correct unless the participant asks them to do so.

What a later tryout would involve

The tryout is planned as a short, guided use of an ordinary, non-sensitive sentence. It follows this path:

1. **Speak.** Use Voiceitt in the usual way to turn speech into text. The text is then placed into Sayloom. Depending on the tryout setup, this may use the normal Voiceitt browser workflow or a clearly labeled copy-and-paste step.

2. **Review.** Sayloom shows the text it received and one prepared version. Any added, removed, or replaced words are made visible. If the suggestion is wrong, the participant can edit the received text and ask Sayloom to try again. Keeping the original is always an option. Confirming that a correction looks right is a separate, deliberate action.
3. **Remember.** After a correction is confirmed, Sayloom may offer a personal preferred term or a known confusion to remember when the change looks as though it may recur. At this point it is only a proposal and is marked as not saved. The participant can decline it, edit it, or explicitly approve it. Nothing is learned or saved automatically.
4. **Copy.** The participant can copy the exact version they prefer. Copying does not mean that they agree with a correction and does not save it. Nothing is sent to another application automatically.

The learning loop is **Confirm → Approve → Next time**. If an approved term or confusion is relevant to similar text later, Sayloom may use it as evidence for a new suggestion. It is not an unconditional replacement rule. The participant reviews the new suggestion and remains in control each time.

Before anyone agrees to participate, we will provide the actual session format, expected time, accessibility arrangements, and the exact privacy terms for the tryout setup. **[Add session length, location or remote format, accessibility contact, compensation if any, and consent details here.]**

The participant remains in charge

Sayloom proposes wording. It does not know for certain what someone said or meant, and a confident-looking suggestion is not proof.

During the tryout, the participant can:

- compare the received and prepared text;
- see which words Sayloom changed;
- edit the received text and try again;
- choose the original or prepared text to copy;
- confirm or decline each correction separately from copying;
- approve, edit, or decline anything Sayloom offers to remember; and
- stop the tryout or skip a question.

Participation should not depend on agreeing with Sayloom. A wrong or confusing suggestion is useful feedback, not a participant mistake.

What is and is not saved

The participant tryout is for text correction, not speech or voice research.

Sayloom does not collect

- source audio or Voiceitt recordings for this text-only correction work;
- information automatically “learned” from using, copying, or confirming text;
- personal terms or known confusions that the participant has not explicitly approved;
- one participant's approved information for use in another person's corrections; or
- a participant's sentence for later research or demonstration without separate, explicit consent.

Sayloom may use during the tryout

- the text received from Voiceitt;
- the prepared text Sayloom suggests;
- optional context the participant chooses to provide for that sentence; and
- that participant's own approved terms or known confusions, if they have chosen to use them.

The received text, prepared text, and optional context are working information for the correction. They are not a personal text history. The exact system used for the tryout, any outside text-processing provider, its privacy terms, and how working text is deleted will be disclosed before consent. If those protections cannot be confirmed, the tryout should not proceed.

Sayloom saves only with a clear reason

If the participant explicitly approves a personal term or known confusion, Sayloom may save that item in a profile belonging only to that participant. The saved item is meant to help with similar future text. It does not include source audio and does not train Voiceitt or a shared model.

We will ask permission before taking feedback notes. Those notes should focus on the experience, not preserve the participant's sentence. **[Add the final feedback-note retention period, who can access the notes, and the contact for access or deletion requests here.]**

What feedback we will ask for

After the guided sentence, we expect to ask questions such as:

- Did the suggestion match what you meant?
- Was it clear what Sayloom changed?
- Was it clear that copying, confirming, and approving a saved item were separate choices?
- Did you understand what Sayloom could remember and what it would not save?
- Did any step feel demanding, rushed, confusing, or inaccessible?
- Would an approved correction reduce repeated effort in your usual writing?
- What would need to change before you would feel comfortable using this again?

This feedback will help identify harmful or confusing suggestions, unclear controls, accessibility barriers, privacy concerns, and parts of the process that require too much effort. It will guide whether Sayloom should move forward, be revised, or stop. Participation is not an endorsement, and positive feedback will not be treated as proof that the product works broadly.

What we can and cannot claim

Before a participant tryout begins, the correction recipe is expected to have passed a private first-user review. That would support testing the next question; it would not establish effectiveness for Voiceitt users generally.

At this stage:

- Sayloom has not been validated by prospective partner participants;
- no community organization or participant should be described as a partner, sponsor, or endorser without a separate agreement;
- there is no claim that Sayloom will always identify the intended word, reduce effort for every user, or be ready for independent everyday use;
- the participant workflow remains a later stage after recipe validation and may change before recruitment begins; and
- Sayloom should not be described as integrated with, approved by, or affiliated with Voiceitt.

The purpose of inviting participants is to gather that missing evidence, not to present it as already established.

Frequently asked questions

Does Sayloom replace Voiceitt?

No. Voiceitt turns speech into text. Sayloom works after that step and considers limited corrections to the resulting text.

Does Sayloom hear or record my voice?

No. Sayloom receives text, not source audio, for this correction work. It cannot compare its suggestion with what was spoken.

Who decides what I meant?

You do. Sayloom can suggest wording, but you can reject it, edit the received text, or keep the original.

Does using or copying a suggestion teach Sayloom automatically?

No. Copying and confirming are separate actions, and neither automatically saves a personal rule. Sayloom saves a preferred term or known confusion only after you explicitly approve that item.

Will my approved information affect someone else?

No. Personal approved terms and known confusions remain isolated to the person who approved them.

Do I need to share a private or important sentence?

No. The guided tryout should use an ordinary, non-sensitive sentence. You can skip a sentence or stop if something feels too personal.

Is Sayloom already proven to work?

No. The first-user checks evaluate whether one correction recipe is ready for a later participant tryout. They do not prove benefit for other people. The tryout is intended to learn what works, what does not, and what must change.

Is this an official Voiceitt study or partnership?

No. Sayloom is independent and unaffiliated with Voiceitt.

Can I ask for access support or involve someone I trust?

Yes. Tell **[accessibility contact]** what would help. You may involve a family member, support person, or communication partner if you choose.

Express interest or ask a question

Contact **[name or organization]**:

- **Email:** [contact email]
- **Phone or text:** [contact number]
- **Accessible contact form:** [link]
- **Preferred contact hours and time zone:** [details]

Please do not send private speech, recordings, medical information, or sample sentences in an initial message. A brief note saying that you are interested in the Sayloom participant tryout is enough. We will share the final participation details and answer questions before asking you to decide.
